PROPOSAL FOR italdizan

Apple Wallet & Google Wallet

Integration for italdizan Loyalty

Digitalization of the loyalty program — real-time, secure, and scalable.

PREPARED BY

Walvero Loyalty

DATE

May 2026

VERSION

1.0

Confidential — Prepared for italdizan

Agenda

What we'll cover in this proposal

01
Understanding Your Needs
Recap of business and technical requirements

02
Our Solution Overview
The Walvero platform at a glance

03
Why Choose Our Platform
Differentiators and proven track record

04
System Architecture
How 1C, the API and the wallets connect

05
Apple & Google Wallet Modules
Pass generation, updates, redemption

06
Real-time Sync & Push
APNS and FCM messaging pipeline

07
1C ↔ API Integration
Endpoints, fields, security, formats

08
End-to-End Business Flows
Registration, earning, redeeming

09
Flow Sequence Diagram
Visual schema of all three flows

10
Card Design Best Practices
UX/UI guidance per platform

11
Security & Privacy
Encryption, isolation, NDA

12
Analytics Dashboard
Sample reports and KPIs

13
Timeline & Phases
Delivery roadmap and milestones

14
Pricing Estimate
Budget breakdown by phase

Understanding italdizan's Needs

Recap of your stated requirements

CURRENT STATE

100%
digital migration target

4
stores / warehouses

1
unique customer ID (phone)

% + AZN
cashback + discount tiers

WHAT YOU REQUESTED

- **Replace plastic cards**
  Full digital migration to Apple & Google Wallet
- **Real-time 1C ↔ API sync**
  Cards generated, updated and synced automatically
- **Card data on pass**
  Name, cashback %, accumulated balance, statuses
- **Push notifications**
  Promo and balance updates pushed to the device
- **Analytics & dashboards**
  Visualisations of purchases, customers, card use
- **Data privacy & NDA**
  Customer data protection and confidentiality

Our Solution Overview

Production-ready loyalty platform with native Wallet support

LoyaltyApi — multi-tenant SaaS, .NET 8 + EF Core

A live, battle-tested platform — Apple Wallet, Google Wallet, POS sync, push notifications, customer enrolment, branch management and analytics — already built and running.

Wallet Cards

Native Apple .pkpass + Google Wallet JWT save-links

Real-time Sync

Card balance and tier updates pushed to devices instantly

Push Notifications

APNS for iOS, FCM for Android — promo + balance alerts

Open API for 1C

REST endpoints with token auth, webhooks back to 1C

Security by Design

Encrypted credentials, tenant isolation, audit logs

Analytics Dashboard

Customers, sales, cards, redemptions, retention

Why Our Platform

Five reasons this proposal de-risks your project

01

Already Built & Production-tested

No greenfield risk. Apple Wallet, Google Wallet, POS sync, customer enrolment and webhooks are fully implemented in the LoyaltyApi codebase.

02

Multi-tenant Architecture

Per-tenant credentials, isolated data, separate Wallet credentials. Scales beyond your 4 stores without re-architecture.

03

Open, Documented API

REST endpoints, Postman collections, OpenAPI/Swagger. Your 1C team can integrate in days, not weeks.

04

Real-time Bi-directional Sync

POS → Wallet (balance updates) and Wallet → POS (redemptions, transactions). APNS + FCM under the hood.

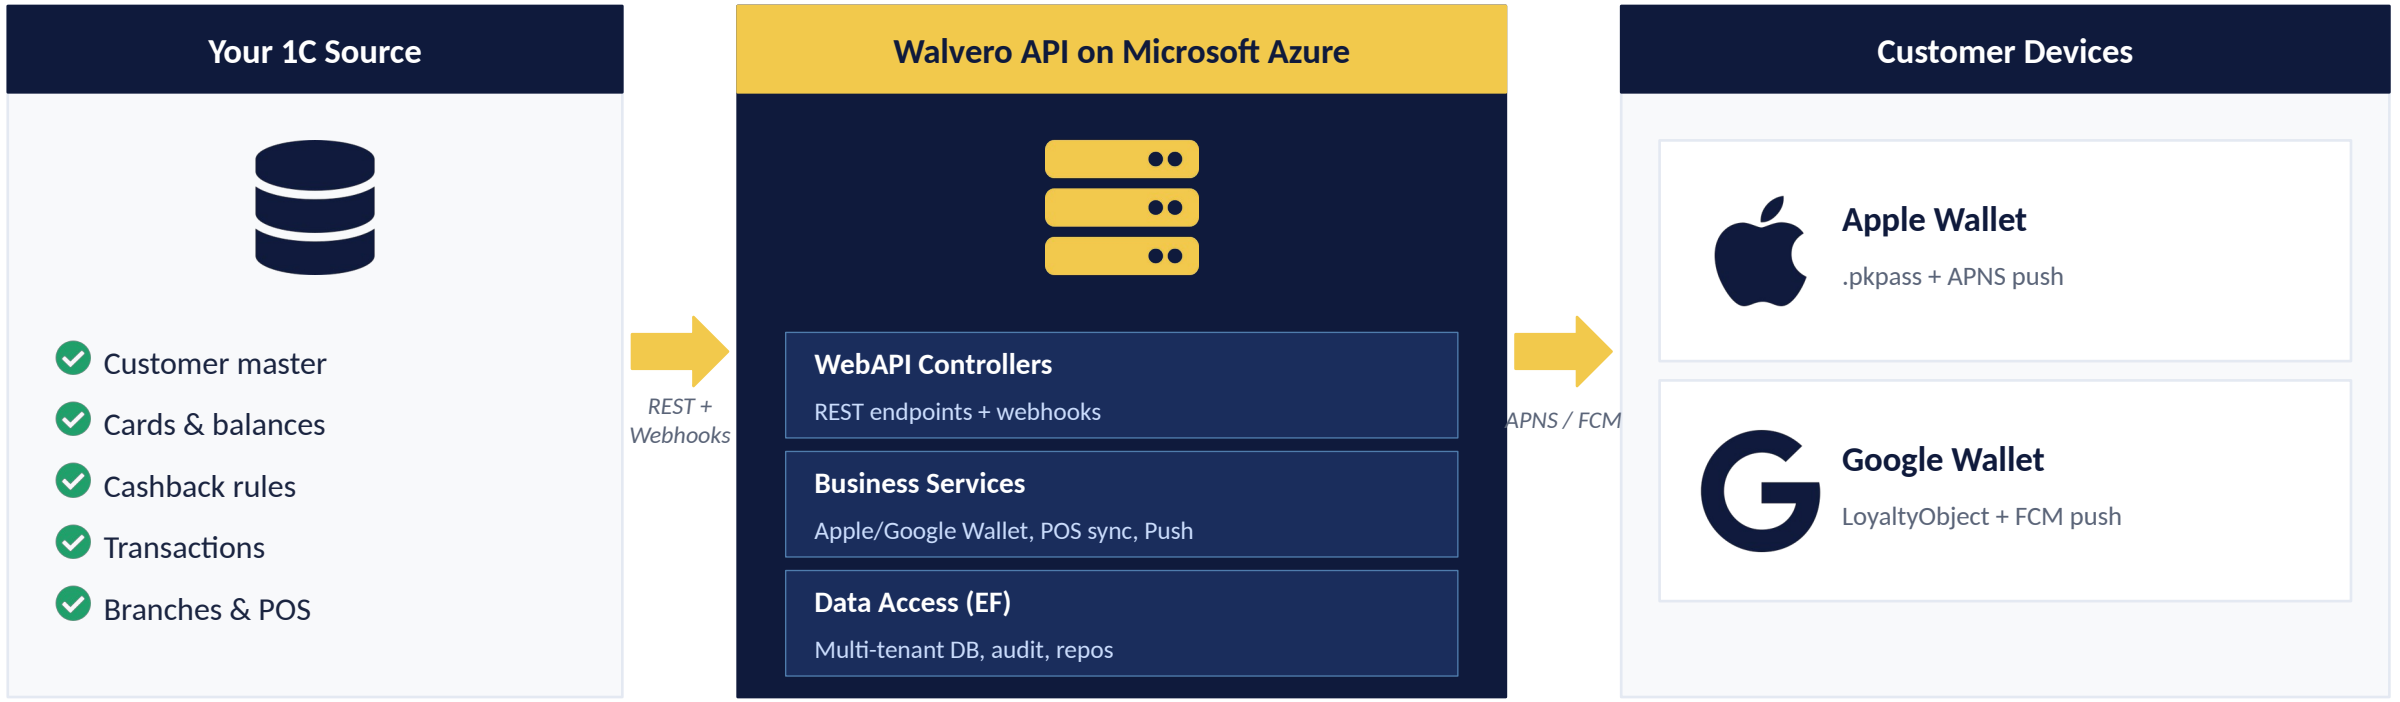

05

Security & Privacy First

Encrypted sensitive data (cert keys, tokens), JWT signing, tenant-scoped tokens. NDA is standard practice.

System Architecture

How 1C, our API and the wallets connect

M·A

Microsoft Stack + Azure Cloud

Built on Microsoft technologies — .NET 8, EF Core, SQL Server — and hosted on Microsoft Azure.

Apple Wallet Integration

Native .pkpass passes — live example from our Mamajan deployment

Live production — Mamajan loyalty card (Apple Wallet)

WHAT WE BUILD

Server-signed, dynamically-updated passes

Customisable design

Logo, colours, hero image, label fields — fully tailored to italdizan brand within Apple's layout guidelines.

Live updates

Balance, cashback %, tier or status field updates push to device without re-install.

APNS push

Server pushes a silent notification → device pulls fresh pass automatically.

PKI signing

Pass type cert + WWDR + tenant key. Stored encrypted in our database.

Add-to-Wallet link

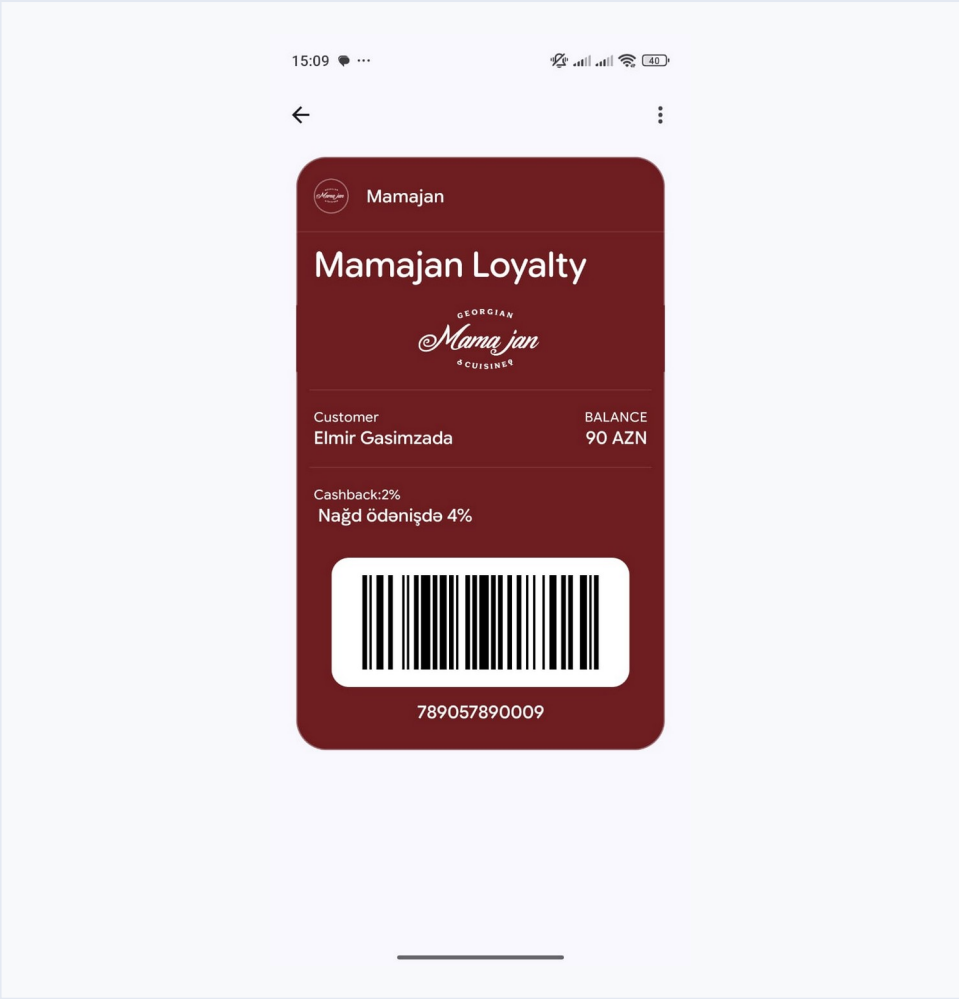

Download URL or QR. Works from SMS, email, or web.

Per-customer pass

Unique serial number; mapped to customer, branch and programme.

Google Wallet Integration

LoyaltyClass + LoyaltyObject — live example from our Mamajan deployment

Live production — Mamajan loyalty card (Google Wallet)

WHAT WE BUILD

LoyaltyObject API + JWT save-links

Customisable design
Logo, hero, programme name, label colours — fully tailored to italdizan brand within Google's layout rules.

LoyaltyObject updates
PATCH the object → all customer devices see new values in seconds.

FCM push (Android)
Custom messages + balance updates via Firebase Cloud Messaging.

Service account auth
Encrypted service-account JSON per tenant; scoped issuer IDs.

Save-to-Wallet JWT
Signed JWT generated per customer — drop-in link or button.

Per-customer object
Unique objectId mapped to programme, customer and branch.

Real-time Sync & Push

From 1C transaction to customer's lock-screen in seconds

01

1C event

Purchase, top-up, tier change

02

Webhook → API

REST call with customer + delta

03

Business logic

Apply rules, persist, recalc

04

Push

APNS for iOS, FCM for Android

05

Updated pass

Wallet refreshes automatically

Typical latency

< 3 seconds end-to-end (POS → pass updated on device)

Notification types

Balance update • Promo • Cashback earned • Reward unlocked

Reliability

Retries with exponential backoff, dead-letter, idempotency keys

1C ↔ API Integration

What we'll expose, what we need, how it's secured

FIELDS WE EXPECT FROM 1C

Logical name	JSON key	Type	Notes
Customer ID	`external_id`	`string`	*required*
Phone number	`phone (E.164)`	`string`	*unique key*
Full name	`full_name`	`string`	*optional*
Cashback %	`cashback_percent`	`decimal`	*required*
Discount %	`discount_percent`	`decimal`	*optional*
Balance	`balance_amount`	`decimal`	*required*
Tier / status	`tier`	`string`	*optional*
Branch / store	`branch_code`	`string`	*required*
Transaction event	`tx { id, amount, type }`	`object`	*webhook*

KEY API ENDPOINTS

POST `/api/wallet/collect`

Customer enrols — phone, OTP, profile

POST `/api/wallet/get_wallet`

Fetch wallet balance + status from 1C

POST `/api/wallet/set_redeem`

Apply redemption / earn event

POST `/api/wallet/set_verify`

Verify OTP for redemption

Auth: tenant-scoped Bearer tokens

HMAC webhook signatures + IP allowlist + TLS 1.2+

End-to-End Business Flows

How customer registration, earning and redemption work in practice

01

Customer Registration

1. Customer fills the form on the Walvero app or web.
2. An OTP is sent to the phone number — verifies ownership.
3. On valid OTP, customer is added to Walvero.
4. Walvero checks italdizan 1C by phone number.
5. If found → pull ID + balance, push to Wallet card.
   If not → call italdizan's add-customer endpoint to create them there.

02

Earning a Bonus

1. Customer makes a purchase at an italdizan store.
2. 1C sends to Walvero: customer ID + purchase amount
   (or the calculated bonus amount).
3. Walvero applies the rule, updates the balance in the database.
4. Wallet card is updated — Apple + Google in real-time.
5. Push notification is sent: “Bonus earned — new balance is X”.

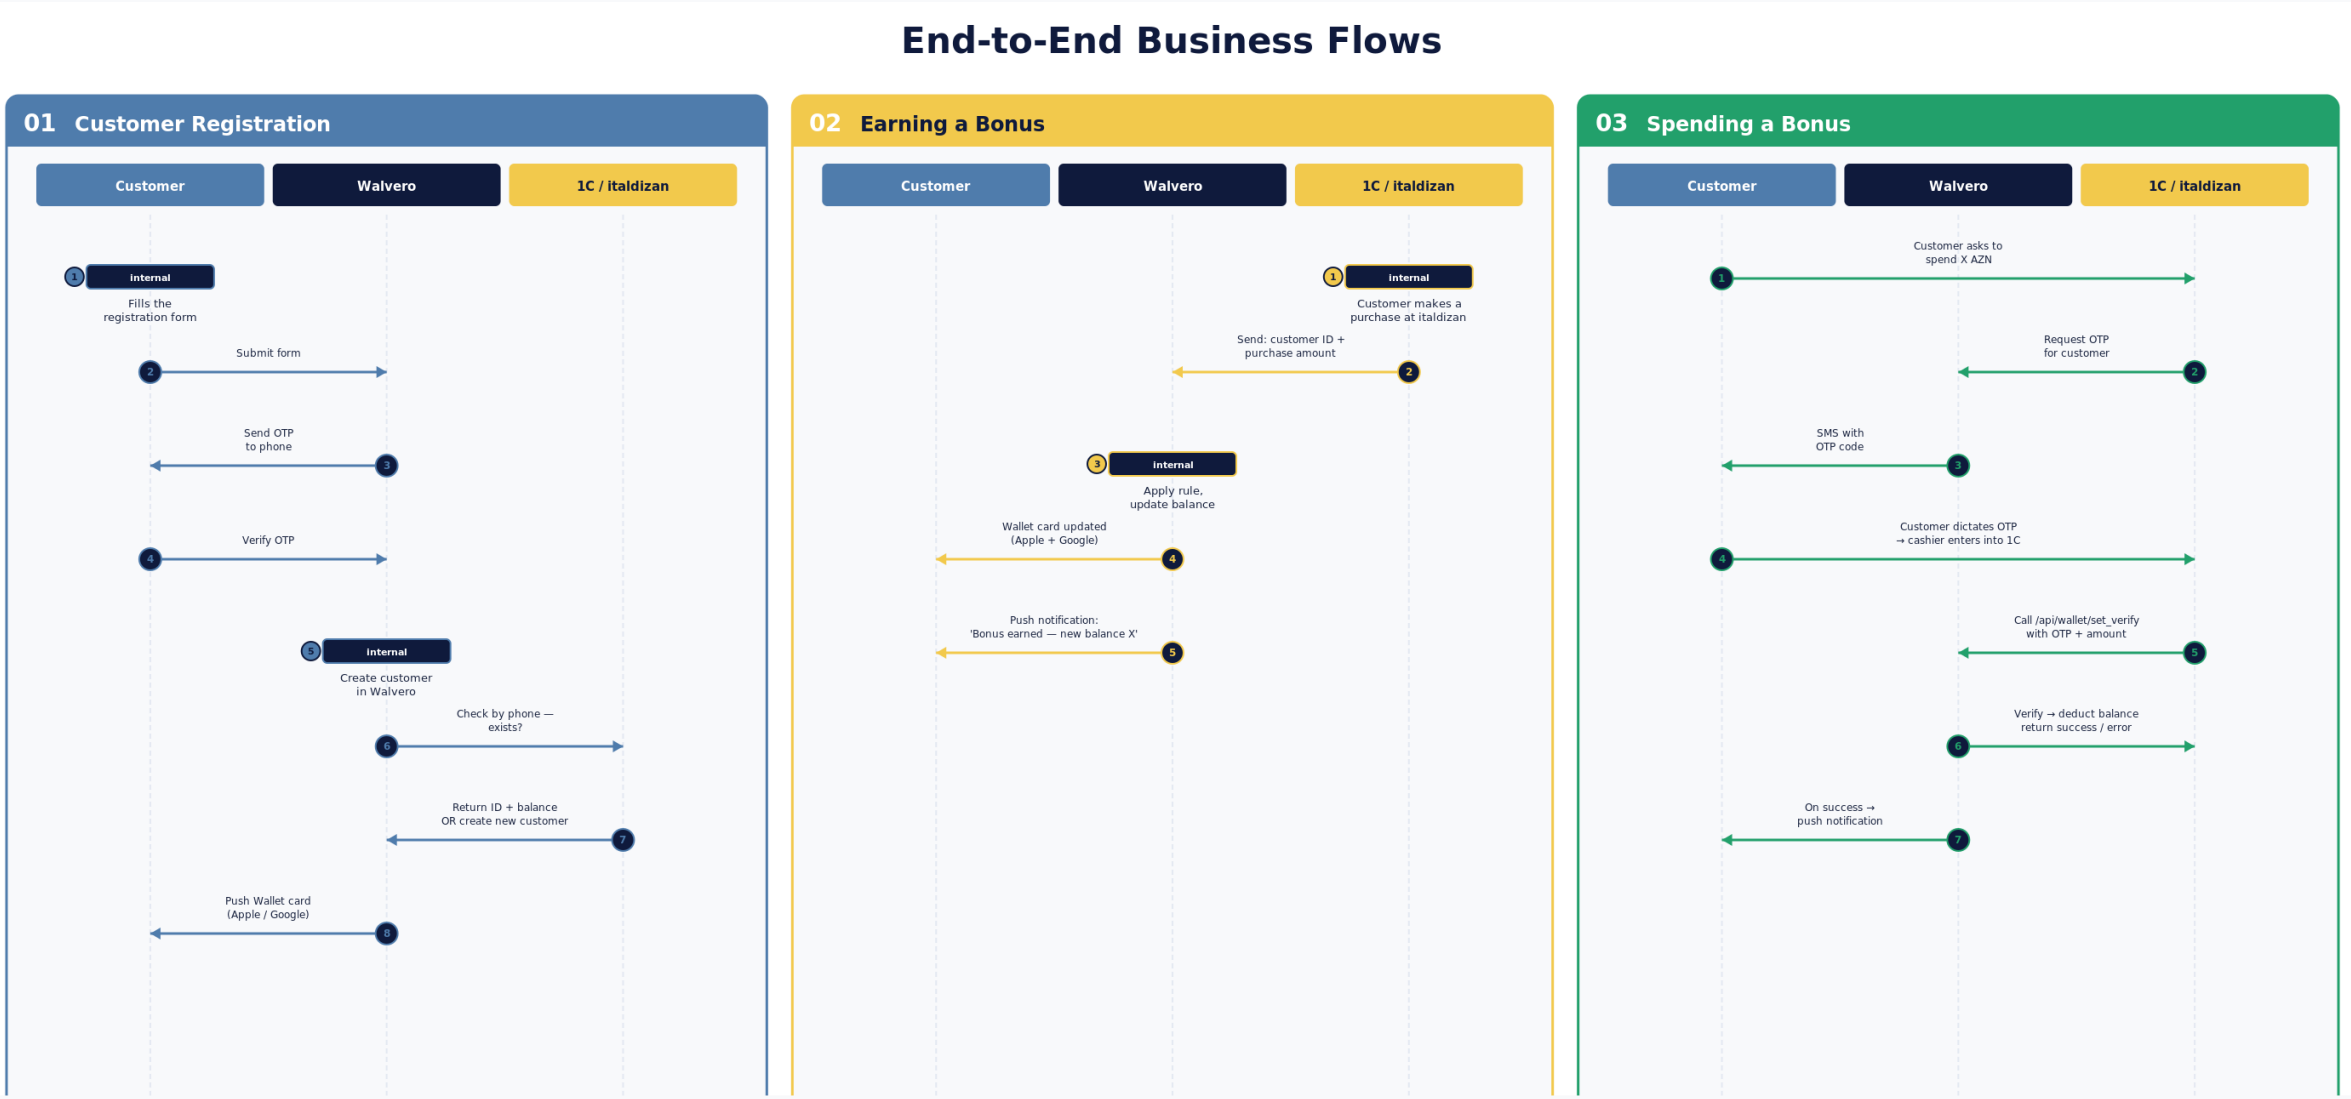

03

Spending a Bonus

1. Customer asks to spend X AZN → SMS with OTP sent to their phone.
2. Cashier enters the OTP code into 1C → 1C calls Walvero.
3. Walvero verifies the OTP.
4. If valid → balance is deducted; success status returned to 1C.
5. Push notification sent to the customer.
   If OTP is wrong → error message returned to 1C.

Business Flow Diagram

Sequence diagram — Customer ↔ Walvero ↔ 1C/italdizan

Wallet Card Design

UX/UI best practices we apply per platform

Apple Wallet

Tightly constrained layout — every label matters

- 5 fields max: header, primary, secondary, auxiliary, back
- Logo + strip image + background tint colour
- Barcode at the bottom (PDF417 or QR)
- Foreground / label / background colours
- Tap-back fields for terms, support, policy links
- Auto-relevancy: locations, beacons (optional)

Google Wallet

More flexible — programme + object hierarchy

- Hero image, logo, programme name visible always
- Custom 'text modules' for additional content
- Linked offers / rewards block
- Account number + tier shown side-by-side
- Rich notification messages (image + CTA)
- Multiple languages via localized fields

Tip: We ship a tenant-branded design system — colours, logo, hero, fonts — configurable from the admin panel.

Security & Privacy

Customer data protection — at rest, in transit, and in process

Encrypted database

All italdizan data — customer records, balances, credentials — is stored in the database in encrypted form, not plaintext.

TLS in transit

HTTPS only. TLS 1.2+, HSTS, modern ciphers. No plaintext customer data ever leaves the API.

Multi-tenant isolation

italdizan's data is fully isolated — separate credentials, integration rows and audit logs. No cross-tenant access possible.

Auth & access control

Tenant-scoped Bearer tokens, role-based admin, IP allowlists for inbound webhooks from 1C.

Auditing & logging

Every wallet event, push and 1C call is logged with correlation IDs and retained for review.

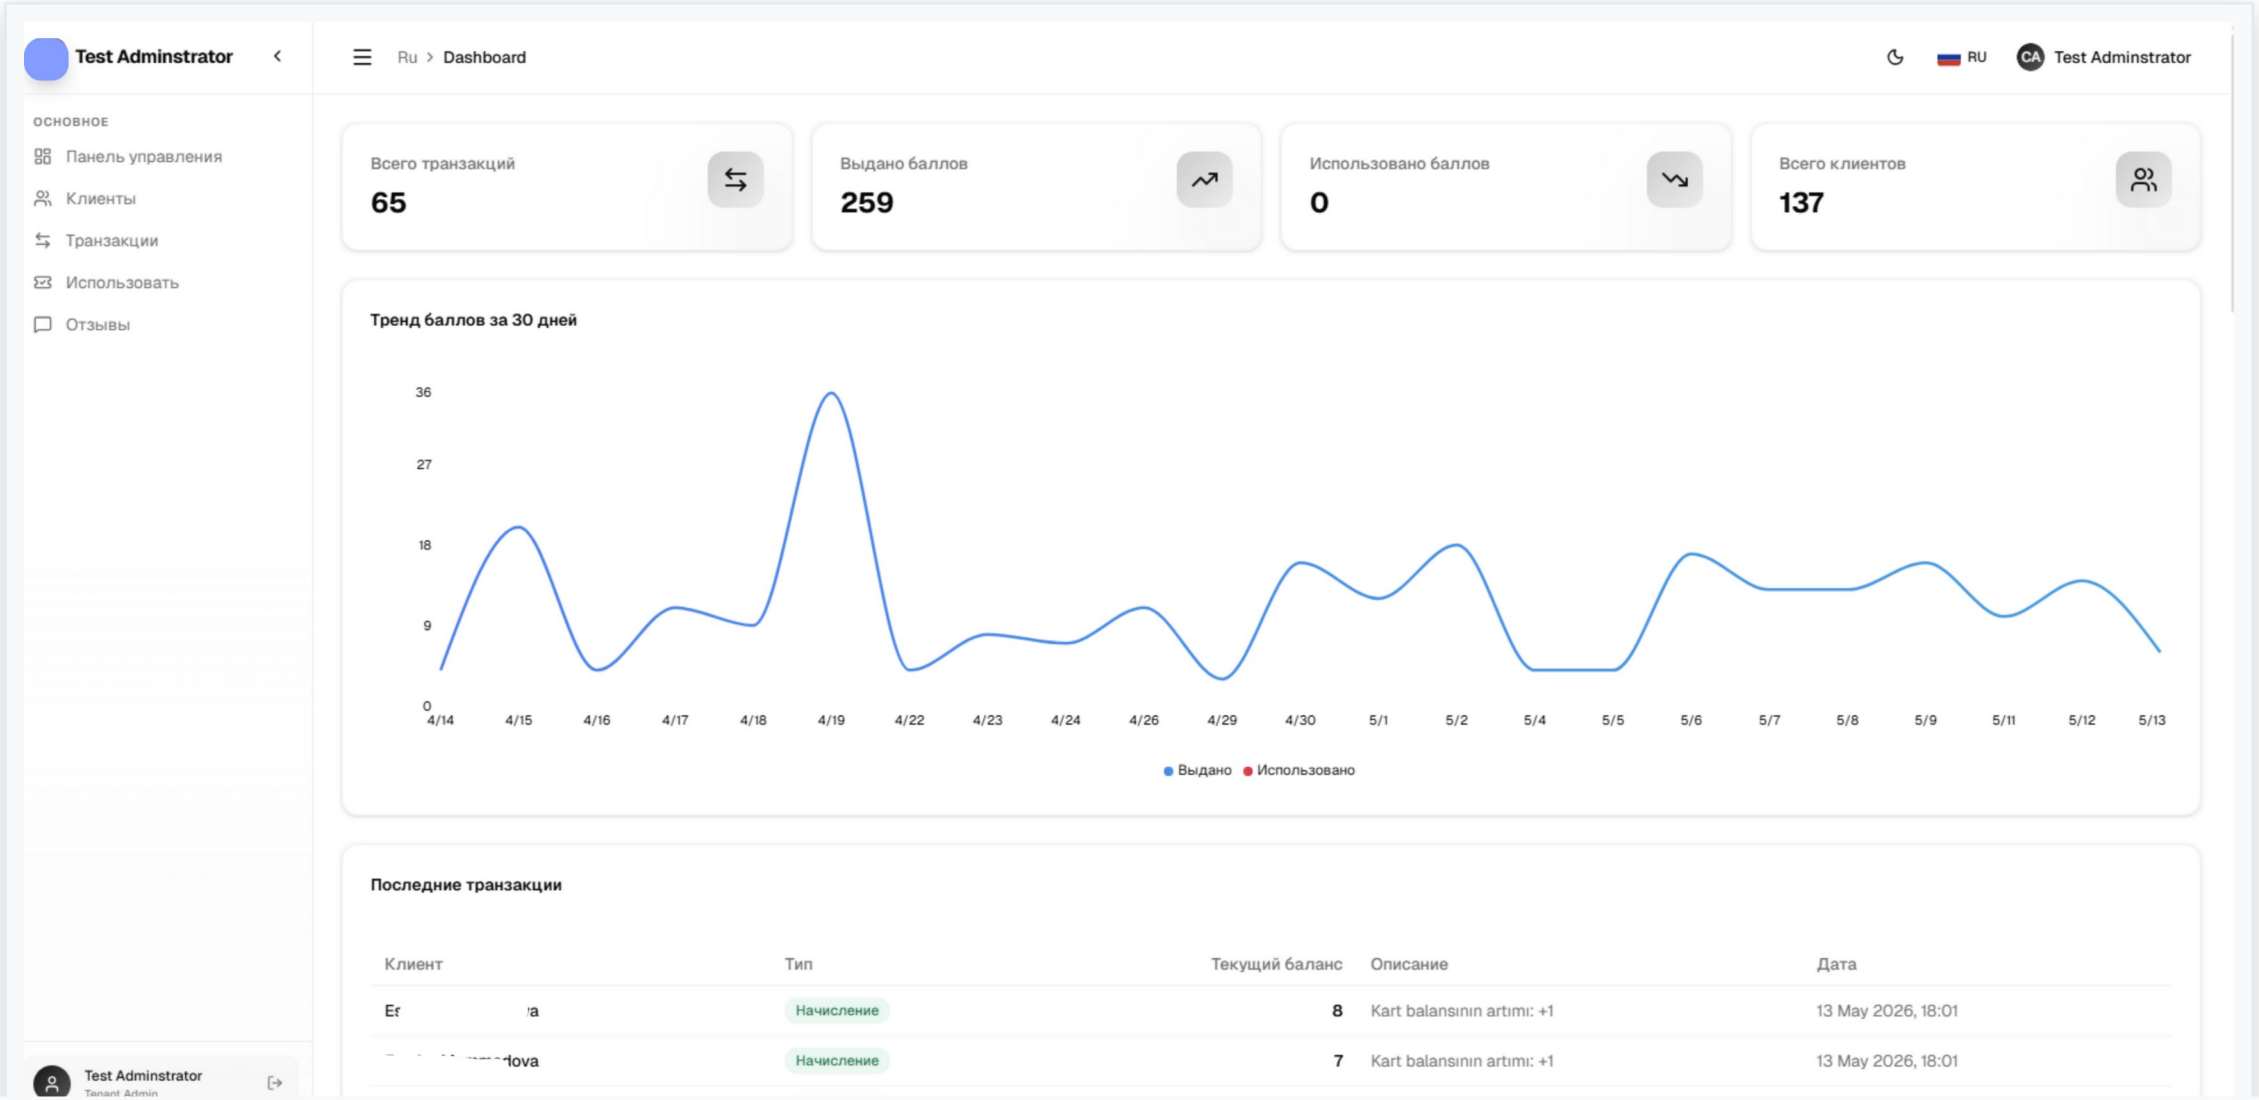

NDA ready

We are ready to sign an NDA on day 1 — no objections. GDPR-friendly retention; right-to-delete supported by design.

Analytics Dashboard

Live example — extra visuals added per italdizan's request

Timeline & Phases

Indicative roadmap — 4 weeks to live, then 2-month free trial

1 **Week 1**

Technical Finalisation

NDA + contract signing, requirements workshop, 1C field mapping, Apple/Google credentials. Output: SRS document.

2 **Week 2**

Design & Trial Approval

Wallet card design per platform (Apple + Google), push templates, trial version review and sign-off.

3 **Weeks 3-4**

Full Delivery

Integration with 1C, push notifications setup, end-to-end testing, training, production cut-over for all 4 stores.

4 **Months 1-2**

Free Trial Period

Live production with full features at no charge. Pay only after the 2-month trial — risk-free for italdizan.

Pricing Estimate

Indicative — confirmed after the discovery workshop

ONE-TIME

Setup

FREE

Initial deployment is on us

- Discovery & technical SRS
- Apple & Google credentials setup
- 1C ↔ API integration
- Wallet card design (Apple + Google)
- End-to-end testing & UAT
- Production cut-over & training

PER POINT OF SALE

Monthly

250 AZN

Per active store / POS

- Hosted Walvero platform
- Apple + Google Wallet pushes
- Real-time 1C ↔ API sync
- Analytics dashboard included
- Standard support (business hours)
- Storage, backups, monitoring

RISK-FREE PILOT

2-Month Trial

Included

First 2 months — no payment

- Full platform — all features
- Real production data
- Push notifications enabled
- Live analytics dashboard
- No commitment until satisfied
- Pay only after the trial period

Example for italdizan (4 stores): 4 × 250 AZN = 1,000 AZN / month, starting after the 2-month free trial. Apple/Google developer-account fees are on the client.

NEXT STEPS

Let’s launch your **digital loyalty cards**

01

Sign NDA & contract

We are NDA-ready — no objections. Contract ready within 48 hours.

02

Free setup begins

We deploy at no cost. Week 1: technical finalisation. Week 2: design approval.

03

Go live + 2-month trial

Weeks 3-4: full rollout. Then 2 months free use before paying anything.
